

For Tuesday morning session:

**WHAT'S HAPPENING TO OUR WATER QUALITY, AND WHAT CAN WE DO ABOUT IT?**

pscartwright@mn.rr.com

The total quantity of available water on this planet is more or less fixed, but the quality is slowly deteriorating. This is the result of demands from an increasing population, as well as other factors.

This paper addresses these factors, details related quality issues and offers possible solutions to meet both drinking water and industrial water demands of the future.
