

# Membrane Growth Opportunities and Limitation

By Scott P. Yaeger

Filtration and Separation Technology LLC

In today's down filtration market, membranes are one of the only bright spots. Most of the focus of membrane growth is in the water and waste water market. While this is an interesting and growing market, it is also getting crowded and highly competitive. Other opportunities are developing for new membrane applications but some face limitations due to the currently available membranes and filtration devices.

This paper will outline some of these developing new applications and how current membrane and device technology can have a good position in exploiting these opportunities and where they will limit exploitation. The author will highlight some developing new membrane and device technologies that have the potential to fill the gap where current technology is limiting.
